

Manufacturer: Multivac
Type: SE130
Year Built: 2006

SE 115 and 130 shrink tunnels: flow-path instead of cycles Sealed packages traverse the shrink tunnel continuously – without any breaks or cycling variations. This is an enormous advantage in terms of reliability and consistency. Two water curtains from above and two from below moisten the package and ensure an all-around perfect shrink result. This is extremely effective in activating the shrink properties of the film with minimal heat exposure for the product.
